Coating Services

In addition to our standard process of preparing the steel plates to SSPC SP-10 and applying preconstruction primers, we are now able to offer an expanded service to tank builders.

As these products are not weldable, our process includes masking a 3” area around each plate of blasted bare steel to facilitate squaring, beveling and welding. We also ensure that the coatings are fully cured before shipping and thin dunnage placed between each plate to ensure that moisture is not trapped during shipping, as well as ensuring that the plates do not come in contact with each other.

As with our standard process, we will provide a complete quality report for each and every plate. If, after blasting inspection we observe any major surface defects, we will provide photographic evidence ensuring that all plates meet typical surface requirements.

We are able to accept steel from any source by rail or truck.

In addition to this new service, we are also able to process flat bar, channel and angle through our processing line.

Typical Coatings Type

Blastech Mobile can now apply a variety of other coatings applied at higher dry film thicknesses (DFT). Typical coatings types include, but are not limited to the following:

- Inorganic zinc coating up to 3-4 mils DFT
- Organic zins 3-5 mils DFT
- High build epoxies 3-5 mils DFT
